

S-109A Introduction to Data Science

Homework 1

Harvard University

Summer 2018

Instructors: Pavlos Protopapas and Kevin Rader

Main Theme: Data Collection - Web Scraping - Data Parsing

Learning Objectives

In this homework, your goal is to learn how to acquire, parse, clean, and analyze data. Initially you read the data from a file, then you scrape them directly from a website. You look for specific pieces of information by parsing the data, you clean the data to prepare them for analysis, and finally, you answer some questions.

Instructions

- To submit your assignment follow the instructions given in Canvas.
- The deliverables in Canvas are: a) This python notebook with your code and answers, b) a .pdf version of this notebook, c) The BibTeX file you created. d) The JSON file you created.
- Exercise **responsible scraping**. Web servers can become slow or unresponsive if they receive too many requests from the same source in a short amount of time. Use a delay of 10 seconds between requests in your code. This helps not to get blocked by the target website. Run the webpage fetching part of the homework only once and do not re-run after you have saved the results in the JSON file (details below).
- Web scraping requests can take several minutes. This is another reason why you should not wait until the last minute to do this homework.

```
In [1]: # import the necessary libraries
%matplotlib inline
import numpy as np
import scipy as sp
import matplotlib as mpl
import matplotlib.cm as cm
import matplotlib.pyplot as plt
import pandas as pd
import time
pd.set_option('display.width', 500)
pd.set_option('display.max_columns', 100)
pd.set_option('display.notebook_repr_html', True)
```

Part A [50 pts]: Help a professor convert his publications to bibTex

Overview

In Part 1 your goal is to parse the HTML page of a Professor containing some of his publications, and answer some questions. This page is provided to you in the file `data/publist_super_clean.html`. There are 44 publications in descending order from No. 244 to No. 200.

You are to use python's **regular expressions**, a powerful way of parsing text. You may **not** use any parsing tool such as BeautifulSoup yet. In doing so you will get more familiar with three of the common file formats for storing and transferring data, which are:

- CSV, a text-based file format used for storing tabular data that are separated by some delimiter, usually comma or space.
- HTML/XML, the stuff the web is made of.
- JavaScript Object Notation(JSON), a text-based open standard designed for transmitting structured data over the web.

Question 1: Parsing using Regular Expressions

1.1 Write a function called `get_pubs` that takes a .html filename as an input and returns a string containing the HTML page in this file (see definition below). Call this function using `data/publist_super_clean.html` as input and name the returned string `prof_pubs`.

1.2 Calculate how many times the author named 'C.M. Friend' appears in the list of publications.

1.3 Find all unique journals and copy them in a variable named `journals`.

1.4 Create a list named `pub_authors` whose elements are strings containing the authors' names for each paper.

Hints

- Look for patterns in the HTML tags that reveal where each piece of information such as the title of the paper, the names of the authors, the journal name, is stored. For example, you might notice that the journal name(s) is contained between the `<I>` HTML tag.
- Each publication has multiple authors.
- C.M. Friend also shows up as Cynthia M. Friend in the file. Count just C. M. Friend.
- There is a comma at the end of the string of authors. You can choose to keep it in the string or remove it and put it back when you write the string as a BibTex entry.
- You want to remove duplicates from the list of journals.

Resources

- **Regular expressions:** a) <https://docs.python.org/3.3/library/re.html> (<https://docs.python.org/3.3/library/re.html>), b) <https://regexone.com> (<https://regexone.com>), and c) <https://docs.python.org/3/howto/regex.html> (<https://docs.python.org/3/howto/regex.html>).

- **HTML:** if you are not familiar with HTML see <https://www.w3schools.com/html/> (<https://www.w3schools.com/html/>), or one of the many tutorials on the internet.
- **Document Object Model (DOM):** for more on this programming interface for HTML and XML documents see https://www.w3schools.com/js/js_htmlDOM.asp (https://www.w3schools.com/js/js_htmlDOM.asp).

1.1

```
In [32]: # import the regular expressions library  
import re
```

```
In [33]: # use this file  
pub_filename = 'data/publist_super_clean.html'
```

```
In [34]: # your code here  
prof_pubs = get_pubs(pub_filename)
```

```
In [35]: # definition of get_pubs  
def get_pubs(filename: str) -> str:  
  
    '''Open the file using the filename.  
  
    Args:  
        filename: A string name of the file.  
  
    Returns:  
        A string containing the HTML page ready to be parsed.  
    '''  
  
    with open(filename, "r") as f:  
        fileString = f.read()  
        postString = fileString.split("<OL START=244>")[1];  
        return postString
```

```
In [36]: # check your code  
print (prof_pubs)
```

Question 2: Parsing and Converting to bibTex using BeautifulSoup

A lot of the bibliographic and publication information is displayed in various websites in a not-so-structured HTML files. Some publishers prefer to store and transmit this information in a .bibTex file which has the following format:

```
@article { _number_
    author = John Doyle
    title = Interaction between atoms
    URL = Papers/PhysRevB_81_085406_2010.pdf
    journal = Phys. Rev. B
    volume = 81
}

@article
{
    author = Ming-Wei Lin, Cheng Ling, Luis A. Agapito, Nicholas Kioussis,
    Yiyang Zhang, Mark Ming-Cheng Cheng
    title = "Approaching the intrinsic band gap in suspended high-mobility
    graphene nanoribbons"
    URL = Papers/2011/PhysRevB_84_125411_2011.pdf
    journal = PHYSICAL REVIEW B
    volume = 84
}
```

About the [bibTex format \(http://www.bibtex.org\)](http://www.bibtex.org).

In Question 2 you are given an .html file containing a list of papers scraped from the author's website and you are to write the information into .bibTex format. We used regular expressions for parsing HTML in the previous question but just regular expressions are hard to use in parsing real-life websites. A useful tool is [BeautifulSoup] (<http://www.crummy.com/software/BeautifulSoup/> (<http://www.crummy.com/software/BeautifulSoup/>)) (BS). You will parse the same file, this time using BS, which makes parsing HTML a lot easier.

2.1 Write a function called `make_soup` that accepts a filename for an HTML file and returns a BS object.

2.2 Write a function that reads in the BS object, parses it, converts it into the .bibTex format using python string manipulation and regular expressions, and writes the data into `publist.bib`. You will need to create that file in your folder.

HINT

- Inspect the HTML code for tags that indicate information chunks such as `title` of the paper. You had already done this in Part 1 when you figured out how to get the name of the journal from the HTML code. The `find_all` method of BeautifulSoup might be useful.
- Question 2.2 is better handled if you break the code into functions, each performing a small task such as finding the author(s) for each paper.
- Make sure you catch exceptions when needed.
- Regular expressions are a great tool for string manipulation.

Resources

- [BeautifulSoup Tutorial \(https://www.dataquest.io/blog/web-scraping-tutorial-python/\)](https://www.dataquest.io/blog/web-scraping-tutorial-python/).
- More about the [BibTex format \(http://www.bibtex.org\)](http://www.bibtex.org).

```
In [166]: # import the necessary libraries
from bs4 import BeautifulSoup
from sys import argv
from urllib.request import urlopen
from urllib.error import HTTPError
```

2.1

```
In [220]: # your code here
file_name = "data/publist_super_clean.html"
soup = make_soup(file_name)

# definition of make_soup
def make_soup(filename: str) -> BeautifulSoup:
    '''Open the file and convert into a BS object.

    Args:
        filename: A string name of the file.

    Returns:
        A BS object containing the HTML page.
    '''
    with open(filename, "r") as f:
        filestring = f.read()
        soup = BeautifulSoup(filestring, "lxml")
    return soup
```

```
In [236]: # check your code: print the BeautifulSoup object, you should see an HT  
ML page  
print(soup.prettify())
```

```

Part B [50 pts]: Follow the stars in IMDb's list of "The Top 100 Stars for 2017"

Overview

In Part 3 your goal is to extract information from IMDb's Top 100 Stars for 2017

(<https://www.imdb.com/list/ls025814950/> (<https://www.imdb.com/list/ls025814950/>)) and perform some analysis on each star in the list. In particular we are interested to know: a) how many performers made their first movie at 17? b) how many performers started as child actors? c) who is the most proliferate actress or actor in IMDb's list of the Top 100 Stars for 2017? . These questions are addressed in more details in the Questions below.

When data is **not** given to us in a file, we need to fetch them using one of the following ways:

- download a file from a source URL
- query a database
- query a web API
- scrape data from the web page

Question 1: Web Scraping Using Beautiful Soup

1.1 Download the webpage of the "Top 100 Stars for 2017" (<https://www.imdb.com/list/ls025814950/> (<https://www.imdb.com/list/ls025814950/>)) into a `requests` object and name it `my_page`. Explain what the following attributes are:

- `my_page.text`,
- `my_page.status_code`,
- `my_page.content`.

1.2 Create a Beautiful Soup object named `star_soup` giving `my_page` as input.

1.3 Write a function called `parse_stars` that accepts `star_soup` as its input and generates a list of dictionaries named `starlist` (see definition below). One of the fields of this dictionary is the `url` of each star's individual page, which you need to scrape and save the contents in the `page` field. Note that there is a ton of information about each star on these webpages.

1.4 Write a function called `create_star_table` to extract information about each star (see function definition for the exact information to extract). **Only extract information from the first box on each star's page. If the first box is acting, consider only acting credits and the star's acting debut, if the first box is Directing, consider only directing credits and directorial debut.**

1.5 Now that you have scraped all the info you need, it's a good practice to save the last data structure you created to disk. That way if you need to re-run from here, you don't need to redo all these requests and parsing. Save this information to a JSON file and **submit** this JSON file in Canvas with your notebook.

1.6 Import the contents of the teaching staff's JSON file (`data/staff_starinfo.json`) into a pandas dataframe. Check the types of variables in each column and clean these variables if needed. Add a new column to your dataframe with the age of each actor when they made first movie (name this column `age_at_first_movie`).

1.7 You are now ready to answer the following intriguing questions:

- How many performers made their first movie at 17?
- How many performers started as child actors? Define child actor as a person less than 12 years old.
- Who is the most prolific actress or actor in IMDb's list of the Top 100 Stars for 2017?

1.8 Make a plot of the number of credits versus the name of actor/actress.

Hints

- Create a variable that groups actors/actresses by the age of their first movie. Use pandas' `.groupby` to divide the dataframe into groups of performers that for example started performing as children (age < 12). The grouped variable is a `GroupBy` pandas object and this object has all of the information needed to then apply some operation to each of the groups.
- When cleaning the data make sure the variables with which you are performing calculations are in numerical format.
- The column with the year has some values that are double, e.g. **'2000-2001'** and the column with age has some empty cells. You need to deal with these before performing calculations on the data!
- You should include both movies and TV shows.

Resources

- The `requests` library makes working with HTTP requests powerful and easy. For more on the `requests` library see <http://docs.python-requests.org/> (<http://docs.python-requests.org/>).

```
In [634]: import requests
```

1.1

```
In [643]: # your code here
my_page = requests.get("https://www.imdb.com/list/ls025814950/")
```

`my_page.text` is the content of the response in unicode.

`my_page.content` is the content of the response in bytes.

`my_page.status_code` is the response's current status code.

1.2

```
In [644]: # your code here
star_soup = BeautifulSoup(my_page.text, 'html.parser')
```

```
In [645]: # check your code - you should see an HTML page  
print (star_soup.prettify()[:])
```

```

1.3

Function

parse_stars

Input

star_soup: the soup object with the scraped page

Returns

a list of dictionaries; each dictionary corresponds to a star profile and has the following data:

- name: the name of the actor/actress as it appears at the top
- gender: 0 or 1: translate the word 'actress' into 1 and 'actor' into '0'
- url: the url of the link under their name that leads to a page with details
- page: the string containing the soup of the text in their individual info page (from url)

Example:

```
{ 'name': Tom Hardy,
  'gender': 0,
  'url': https://www.imdb.com/name/nm0362766/?ref_=nm1s_hd,
  'page': BS object with 'html text acquired by scraping the 'url' page'
}
```

```

In [679]: # your code here

1.4

Function

create_star_table

Input

the starlist

Returns

a list of dictionaries; each dictionary corresponds to a star profile and has the following data:

star_name: the name of the actor/actress as it appears at the top
gender: 0 or 1 (1 for 'actress' and 0 for 'actor')
year_born : year they were born
first_movie: title of their first movie or TV show
year_first_movie: the year they made their first movie or TV show
credits: number of movies or TV shows they have made in their career.

Example:

```
{ 'star_name': Tom Hardy,  
  'gender': 0,  
  'year_born': 1997,  
  'first_movie' : 'Batman',  
  'year_first_movie' : 2017,  
  'credits' : 24}
```

```
In [686]: # your code here
def create_star_table(starlist: list) -> list:
    star_table = []
    for star in starlist:

        star_soup = star.get('page')

        born_regex = r"nm_ov_bth_year\">(.*?)</a>"
        try:
